## Method and System for Synchronization Between Different Content Encoding Formats

### Abstract

A method, system and program product are described for synchronizing content stored in  
5 different encoding formats, only one of which includes timecode support, the invention involving  
accessing content stored at a first format, the first content having timecodes superimposed on its  
frames, determining the superimposed timecodes of first and second representative frames of the  
first content, determining the frame numbers corresponding to the first and second representative  
frames, and using the determined timecodes and frame numbers to determine general  
10 correspondence information between frame numbers and timecodes of the first format.
